                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, CC their use in the discovery of novel antibiotics, the essential genes CC themselves and the encoded proteins. The prokaryotes used are Escherichia CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, CC pseudomonas aeruginosa aureus, Salmonella typhi, Klebsiella pneumoniae, CC useful for the identification of potential new targets for antibiotic CC development. The antisense nucleic acids can also be used to identify CC proteins used in proliferation, to express these proteins, and to obtain CC antibodies capable of binding to the expressed proteins, and to obtain CC antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The can used to screen compounds in rational drug discovery programmes. The contisense nucleic acids sequence is also useful to screen for homologous CC useful are proliferation protein. Note: The sequence data for this patent CC did not form part of the printed specification, but was obtained in CC electronic formation protectly from WIPO at

                                                                  US-10-039-183A-4 (1-399)
                                                                                                                                                                                                                                      This DNA sequence codes for a 50 kDa Helicobacter pylori polypeptide (see CR AAW73035) designated GHPO 750. A polypucleotide encoding GHPO 750 can be CC obtained from genomic DNA by PCR amplification (see AAV07971-72. The CC invention provides polypucleotides (see AAV72001, AAV07912-21 and CC AAV07963-64) encoding a family 76 kDa Helicobacter polypeptides (see CAAV73022-32), GHPO 750 and a 32 kDa polypeptide (see AAW73034). These CC polynucleotides were initially identified in a search of H. pylori CC genomic databases. DNA cassettes for expression of the Helicobacter CC proteins (unprocessed or mature forms) in prokaryotic or eukaryotic cells CC are provided. The polynucleotides can be used in vacciness to prevent or treat Hb infection in a mammal. Viral (especially poxvirus) or bacterial CC vectors are used. Products and methods of the invention allow treatment CC and prevention of gastroduodenal diseases associated with Hb infections, CC diseases, e.g. gastric and duodenal ulcers. Diagnostic and detection controlled. GHPO 750 was demonstrated to be a protective anticon are also provided. GHPO 750 was demonstrated to be a protective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastroduodenal diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GHPO

the 6213 antisence sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated concluded are: (6) polypeptide or its fragment whose expression is inhibited by the antisense concluded acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular containing the polypeptide; (6) inhibiting cellular contiferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway conceptived for proliferation, or that inhibits cellular proliferation; (8) compound that influences the activity of configuration of the biological pathway in which a proliferation, or that inhibits cellular proliferation of a gene required for cellular proliferation or the biological pathway in which the test compound that inhibits proliferation of a compound's activity; (11) a culture comprising strains in which the gene cor a gene on which the test compound that inhibits proliferation of a compound's activity; (11) a culture comprising strains in which the gene cor dentifying proteins or screening for homologous nucleic acids are useful for cellular proliferation in collate candidate molecules for rational corequired for proliferation in collate candidate molecules for rational configuration. The process that candidate molecules colds required corequired for proliferation in cells other than S. aureus, S. typhimurium, colling the target of a compound that inhibits the proliferation of the proliferation in cells other than S. aureus, S. typhimurium, colling the process of the target of a compound that inhibits acids are useful acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              21-MAR-2001; 2001US-00815242.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Frazer CM, hi
The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAAB1453 to AAAB2444 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAAB1260 to AAAB1303 and AAB25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAAB1254 to AAAB1259 and AAAB1304 to AAAB13121 represent PRC primers used in the isolation of Neisseria meningitidis DNA sequences; and AAAB1222 to AAAB1452 represent Neisseria meningitidis DNA sequences; and AAAB1222 to AAAB1452 represent Neisseria meningitidis MenB polymucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neisseria meningitidis; Neisseria gonorrheae; genome; immunogenic; antigen; vaccine; diagnosis; infection; antibacterial; identification;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than other more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 17782 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     preventing or diagnosing infection due to Neisserial bacteria.

                                                                                                                                                                                                                        The present invention describes the full length genome of Neisseria CC meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 CC represent fragments of the NMB genomic sequence, as the sequence was too CC long to go in a record on ite own it was split into 8 sequences which CC overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21607 are repeated at the beginning of CC AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of CC AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins GC given in AAB58550 to AAB58533, and AAF21589 to AAF21606 represent PCR CC primers which are used in the exemplification of the present invention. CC The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions CC diagnostic reagent for detecting the presence of Neisserial bacteria or a CC diagnostic reagent for detecting the presence of Neisserial bacteria or a CC diagnostic reagent for detecting the presence of Neisserial bacteria or a fantibodies raised to Neisserial bacteria. Computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins swhich are more effective in vaccines than the

                                                                                                                                                                                 The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia (CC life themselves are the encoded proteins. The prokaryotes used are Escherichia (CC life themselves are used a Entercocccus faecalis. The invention is also (CC useful for the identification of potential new targets for antibiotic (CC development. The antisense nucleic acids can also be used to identify (CC proteins used in proliferation, to express these proteins, and to obtain (CC antibodies capable of binding to the expressed proteins. The proteins can (CC be used to screen compounds in rational drug discovery programmes. The continense nucleic acids which are required for cell proliferation in a wide variety (CC of organisms. The present sequence encodes an essential prokaryotic (CC cellular proliferation protein. Note: The sequence data for this patent (CC did not form mark of the notion).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Вb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
the 5213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid cencoding a polypeptide whose expression is inhibited by the antisense conclusic acid; (2) a host cell containing the vector; (3) an isolated converge to the polypeptide or its fragment whose expression is inhibited by the converge to the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular converge to polypeptide; (5) producing the polypeptide; (6) inhibiting cellular converge to polypeptide; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway converged for proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a converge product is overexpressed or underexpressed; (12) determining the extent
                                                                                                                                                                                                                                                                                                                                                                Wang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

This invention relates to the identification of novel protein targets for the development of antimicrobial drugs against pathogenic bacteria. Specifically, it refers to recombinant proteins derived from Staphylococcus aureus, Helicobacter pylori, Streptococcus pneumoniae, Escherichia coli, Enterococcus faccalis or Pseudomonas aeruginosa. The present invention describes providing a three-dimensional structure for these crystallised proteins to identify a potential modulator for the prevention or treatment of microbial diseases. Furthermore, contacting a protein with a modulator can be useful for assaying protein activity and hence its viability in drug composition or vaccine. Accordingly, such compositions can be useful for treating bacterial infections, developing antibacterial agents useful as food preservatives or treating food products to eliminate potential pathogens. This polymucleotide sequence is a bacterial DNA encoding a protein target of the invention.
                                                                                                                                                                                                                                                                                                                                                                          Edwards A, onsoury K, P

                                                                     Pred.
                                                                                    Alignment
                                                                                                                                                 The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the genes, CC their use in the discovery of novel antibiotics, the essential genes CC themselves and the encoded proteins. The prokaryotes used are Escherichia CC coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, CC pseudomonas aeruginosa and Enterococcus faecalis. The invention is also CC useful for the identification of potential new targets for antibiotic CC development. The antisense nucleic acids can also be used to identify CC proteins used in proliferation, to express these proteins. and to obtain CC antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The cantisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety CC of organisms. The present sequence encodes an essential prokaryotic CC cellular proliferation protein. Note: The sequence data for this patent CC did not form part of the printed specification, but was obtained in CC electronic format directly from WIPO at

The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression cc of the nucleic acid inhibits proliferation of a cell. Also included are: CC (1) a vector comprising a promoter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense culticacid; (2) a host cell containing the vector; (3) an isolated cc nucleic acid; (2) a host cell containing the vector; (3) an isolated cc polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding cc proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) cc identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound that inhibits the gene proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required conjudication in cells other than S. aureus, S. typhimurium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  300
```

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the

This invention relates to the identification of novel protein targets for the development of antimicrobial drugs against pathogenic bacteria. Specifically, it refers to recombinant proteins derived from Staphylococcus aureus, Helicobacter pylori, Streptococcus pneumoniae, Escherichia coli, Enterococcus faccalis or Pseudomonas aeruginosa. The present invention describes providing a three-dimensional structure for these crystallised proteins to identify a potential modulator for the prevention or treatment of microbial diseases. Furthermore, contacting a protein with a modulator can be useful for assaying protein activity and hence its viability in drug composition or vaccine. Accordingly, such compositions can be useful for treating bacterial infections, developing antibacterial agents useful as food preservatives or treating food
                                                                                                                                                                                                                                                                                                                                                                                  Mansoury K, Mcdonald M,
                                                                                                                                                                                                                  Claim
                                                                                                                                                                                                                                               Bacterial polypeptide composition use infection, has isolated, recombinant binding protein Era from Pseudomonas from Enterococcus faecalis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-NOV-2003;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                88

                                                                                                                                                                                                                                                                                                                          Patent No. 5994066
GENERAL INFORMATION:
APPLICANT: BERGER
APPLICANT: PICARD
                                                                                                                                                                                                                                                                                                                                                                                        Sequence 185, Application US/08743637B
                                                                                                                                                                                       APPLICANT: OUELLETTE, Marc

APPLICANT: ROY, Paul H.

TITLE OF INVENTION: SPECIES-SPECIFIC AND UNIVERSAL DNA

TITLE OF INVENTION: PROBES AND AMPLIFICATION PRIMERS TO RAPIDLY DETECT AND

TITLE OF INVENTION: IDENTIFY COMMON BACTERIAL PACHOGENS AND ASSOCIATED

TITLE OF INVENTION: ANTIBIOTIC RESISTANCE GENES FROM CLINICAL SPECIMENS ...

NUMBER OF SEQUENCES: 273
